Application No. 10/660,577

Amendment filed November 28, 2006

Reply to Office Action of September 6, 2006

NOV 2 8 2006

Docket No.: 0505-1246P Page 2 of13

AMENDMENTS TO THE CLAIMS

1. (Currently Amended) A lubricating system for an internal combustion engine imprising:

a lubricating oil tank being integral with a crankcase and being partitioned from a crank chamber by a <u>tank partition</u> wall projecting from an inside wall of said crankcase;

a recovery pump by which lubricating oil dropping to and dwelling in a bottom portion of said erankease crank chamber after lubricating individual portions of said internal combustion engine is sucked through a pump suction port opened in said bottom portion of said erankease crank chamber and is fed to said lubricating oil tank; and

a supply pump for supplying said lubricating oil from said <u>lubricating</u> oil tank to said individual portions of said internal combustion engine;

an overflow oil passage wall projecting from said inside wall of said crank chamber extends downwardly; and

wherein said lubricating system comprises an overflow oil passage formed in said tank wall partition and said overflow oil passage wall extending substantially parallel to said tank partition wall, through which said lubricating oil that flows over the upper edge of a said tank partition wall of said lubricating oil tank is led to a said pump suction port of said recovery pump.

2. (Canceled).

- 3. (Currently Amended) The lubricating system for an internal combustion engine according to claim 21, wherein said lubricating oil tank is formed in a roughly crescent shape along an outside wall of said crankcase.
- 4. (Currently Amended) The lubricating system for an internal combustion engine according to claim 1, wherein said lubricating oil tank—an oil sump is disposed in a lowermost portion of said crankcase and oil disposed therein is free from being stirred by a crankshaft and speed change gears.

5. (Currently Amended) The lubricating system for an internal combustion engine

according to claim 14, and further including a cutout formed in the said tank partition wall for

enabling oil dwelling on an upper surface of the said tank partition wall to flow downwardly

through the cutout into an-said oil sump.

6. (Currently Amended) The lubricating system for an internal combustion engine

according to claim 1, wherein said recovery pump is a trochoid pump and said supply pump and

said recovery pump are mounted on a single shaft for rotation.

7. (Currently Amended) A lubricating system for an internal combustion engine

comprising:

a lubricating oil tank formed within a crankcase and being partitioned from a crank

chamber by a tank partition wall projecting from an inside wall of said crankcase;

a recovery pump by which lubricating oil dropping to and dwelling in a bottom portion of

said erankease crank chamber after lubricating individual portions of said internal combustion

engine is sucked through a pump suction port opened in said bottom portion of said erankease

crank chamber and is fed to said lubricating oil tank; and

an overflow oil passage wall projecting from said inside wall of said crank chamber

extends downwardly; and

an overflow oil passage formed in said tank partition wall and said overflow oil passage

wall extending substantially parallel to said tank partition wall, through which said lubricating oil

that flows over the upper edge of asaid tank partition wall of said lubricating oil tank is led to a

said pump suction port of said recovery pump.

8. (Canceled).

9. (Currently Amended) The lubricating system for an internal combustion engine

according to claim 87, wherein said lubricating oil tank is formed in a roughly crescent shape

along an outside wall of said crankcase.

10. (Currently Amended) The lubricating system for an internal combustion engine

according to claim 7, wherein said lubricating oil tankan oil sump is disposed in a lowermost

portion of said crankcase and oil disposed therein is free from being stirred by a crankshaft and

speed change gears.

11. (Currently Amended) The lubricating system for an internal combustion engine

according to claim 710, and further including a cutout formed in the said tank partition wall for

enabling oil dwelling on an upper surface of the said tank partition wall to flow downwardly

through the cutout into an-said oil sump.

12. (Currently Amended) A lubricating system adapted for use with an internal

combustion engine comprising:

a crankcase;

a tank partition wall form in said crankcase;

a lubricating oil tank formed in the crankcase and being partitioned from a crank chamber

by the <u>tank</u> partition wall projecting from an inside wall of said crankcase;

a recovery pump for pumping lubricating oil disposed in a bottom portion of said

crankcase through a pump suction port opened in said bottom portion of said crankcase and for

feeding said oil to said lubricating oil tank; and

an overflow oil passage wall projecting from said inside wall of said crank chamber

extends downwardly; and

an overflow oil passage formed in said tank partition wall and said overflow oil passage

wall extending substantially parallel to said tank partition wall, through which said lubricating oil

that flows over the upper edge of a-said tank partition wall of said lubricating oil tank is led to

the pump suction port of said recovery pump.

combustion engine according to claim 1312, wherein said lubricating oil tank is formed in a

roughly crescent shape along an outside wall of said crankcase.

(Currently Amended) The lubricating system adapted for use with an internal

combustion engine according to claim 12, wherein said lubricating oil tankan oil sump is

disposed in a lowermost portion of said crankcase and oil disposed therein is free from being

stirred by a crankshaft and speed change gears.

16. (Currently Amended) The lubricating system adapted for use with an internal

combustion engine according to claim 12, and further including a cutout formed in the said tank

partition wall for enabling oil dwelling on an upper surface of the said tank partition wall to flow

downwardly through the cutout into an oil sump.
